State College, PA, June 6, 2016 — Amelia's Compass announces their new **ButtonPusher** footswitch. ButtonPusher is a generic momentary footswitch (normally-open) that features an exceptionally well-made switch component and parallel-wired 1/4" connectors. It can be used to control any product that has a 1/4" input for momentary footswitch control.

Because it has two jacks instead of one, you can daisy-chain multiple ButtonPushers across the stage to engage the target function from wherever you're standing.

ButtonPusher was created for use with our ControllerHub 8 product. The ControllerHub 8 has eight inputs to connect all types of expression pedals and on/off switches to your rig, providing hands-free control of audio parameters in your hardware or software.

While ControllerHub 8 works great with your favorite 3rd-party footswitches, we suggest you consider our ButtonPusher. It's made in the USA using architectural aluminum extrusion with 1/8" wall thickness, so it's lightweight yet extremely durable. The footswitch itself has a satisfying but soft click. You simply can't buy a better footswitch.

ButtonPusher is available now. For more information, visit www.ameliascompass.com.
